

## WE CAN REMOVE THE FOLLOWING TATTOOS

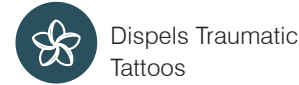

Pigment Migration

Unwanted Tattoos

Permanent Makeup

Disperses Traumatic Tattoos

### Some reasons why clients choose a tattoo removal procedure

- A bad tattoo. Poorly executed by an amateur tattoo artist, or a misspelled tattoo
- The tattoo has become faded and blurry
- Name removal after a relationship ended
- Your taste has changed
- In some professions, having a visible tattoo is unacceptable or deemed unprofessional
- You want a different tattoo or have it completely removed

### How does it work?

It works by firing laser light into the tattoo which breaks the ink into tiny pieces, these little pieces are easy for the body to absorb. This allows the ink to be removed from the body. Laser tattoo removal won't damage the skin, unlike other tattoo removal methods.

### Is laser tattoo removal painful?

It can be uncomfortable. People who have had laser tattoo-removal treatment compare it to the snap of an elastic band against the skin. However, we all experience pain differently and tolerance is a variable factor. In preparation for your treatment, you may wish to take an over-the-counter, non-Aspirin®. DO NOT take Aspirin® products as they can increase the risk of bruising and / or bleeding. Please consult us for more information.

# TATTOO REMOVAL

BY HAPPY HEART HEALTH

*You do not have to live with an unwanted tattoo forever! We can help you with the safe and correct way to remove unwanted tattoos.*

- Fitzpatrick skin type
- Tattoo layering (if the tattoo is a cover-up)
- Location on the body
- Ink / pigment colors and intensity
- Pre-existing scarring

*We will discuss your personalized treatment regiment during your consultation.*

### Is it safe?

Yes, it is. When performed correctly by a certified, experienced laser technician, laser tattoo removal is both safe and effective. However, it is a clinical procedure. As such, there is a potential for associated risks. We will not perform any procedures without first assessing your medical history, current health condition, and any potential you may have for complications.

### Your type of removal procedure

Tattoo types vary according to etiology, pigment, depth, and purpose. Cosmetic tattoos ("permanent makeup") often serve to enhance physical features or mask scars; traumatic tattoos result from an injury in which foreign material is embedded in the skin.

### Are there any precautions to take before removal procedures?

Strict sun protection measures must be emphasized to all patients. Melanin in the epidermis can compete for the absorption of laser light intended for tattoo removal. This can cause destruction of the melanin containing cells and manifest as dyspigmentation, blistering or scarring. The use of longer wavelengths in patients with a tan or patients with darker skin types can reduce such absorption by epidermal melanin and reduce the risk of complications.

### How many treatments will I need?

The number of treatments differs for individuals. Various factors will determine the number of treatments. Some include:
